Dec 27, 2018 yourlovealwaysplit_40558. So, when I do my_category = 'video' I get: In [90]: ['small video', 'medium video', 'large video'] Out[90]: ['small video', 'medium video', 'large video'] But when I do my_category = 'story' I get: In [92]: ['A story'] Out[92]: [] Now, how can I tell in the loop if it's the first or second result that is being filtered by the specific my_category? A: You can do it in a single line using list comprehension and enumerate() method. my_category = ['story', 'video'] my_subcategory = ['small', 'medium', 'large'] [x for x,y in enumerate(my_category) if y in my_subcategory] Out[97]: ['A story'] Q: How to auto generate an attribute with JAXB When using an XSD as the input, is there a way to programmatically generate the following XML using Java code? value A: You can make an element with an attribute by specifying the desired name and desired namespace as well as the desired name of the attribute. try { JAXBContext ctx = JAXBContext.newInstance(Root.class); Unmarshaller u = ctx.createUnmarshaller(); JAXBElement element = (JAXBElement) u.unmarshal(new StreamSource(new File("/path/to/file.xml"))); System.out.println(element); Root root = element.getValue(); System.out.println(root.getSubsubsub()); } catch (JAXBException e) { e.printStackTrace(); } For more information on the JAXB Unmarshaller check out the reference documentation.
