Circadian rhythm of peripheral vascular resistance and hemodynamics in patients with systemic sclerosis. To investigate the circadian variation of hemodynamics and peripheral vascular resistance in patients with systemic sclerosis (SSc) and to examine the relationship between vascular endothelial dysfunction and the circadian variation of hemodynamics. Case-control study. University hospital. Patients with SSc (n=18) and healthy controls (n=10). Patients underwent 24-hour ambulatory blood pressure monitoring. Hemodynamic parameters, such as heart rate, blood pressure, central venous pressure, and respiratory volume, were assessed every 30 minutes. The vascular endothelial function was assessed as the percent decrease in forearm blood flow (FBF) after infusions of acetylcholine (Ach). The circadian variation of peripheral vascular resistance was defined as the magnitude of the amplitude of the 24-hour blood pressure, heart rate, and vascular resistance. The circadian variation of vascular resistance was significantly larger in the SSc patients than in the controls. There was a significant inverse correlation between the Ach-induced percent decrease in FBF and the amplitude of vascular resistance in the SSc patients (r=-0.570, pIn many chemical processes it is desirable to measure the concentration of a particular component in a solution. For example, in the production of gluconic acid, glucose is oxidized to gluconic acid. A reagent is employed which is essentially colorless but has an absorption maximum at about 450 nm. This reagent reacts with gluconic acid to give a complex with an absorption maximum at about
