KeyMacro has many features and may be used to automate all aspects of your daily tasks. A graphical user interface is included, but if you want, the program is also very easy to use with a keyboard. Use KeyMacro to record and run macros in Microsoft Office applications. Click to Download the Macro Recorder or KeyMacro In the Windows world, there's something called Windows Remote Desktop (WinRDP). This is a remote desktop protocol that comes as part of Microsoft Remote Desktop Connection 4 and lets you control a remote machine with a graphical desktop. This program is useful for when you want to run a program on a PC or network device that is not your own, but you would still like to control it and be able to view its desktop. It may be that you are trying to run an application on a computer at work that is owned by the IT department, or even running a custom desktop, but you do not have access to that PC's software. There are a couple of things to note. You can only control the desktop of a remote machine. You cannot see the remote desktop at all. Additionally, you cannot open the remote desktop program directly. You need to open Remote Desktop Connection, which will then bring up a connection window for your current system. You can also use this protocol to run programs. So far, the program does not seem to allow you to start any Windows XP programs directly. If you try to open a word processor or other WinXP app, it will attempt to run the program locally. This is not what you want. The nice thing about this program is that you can control the remote computer from any location with an Internet connection. You can also use it to run Windows Vista applications on a Windows XP machine (assuming you have a Windows Vista compatible application), but again, you cannot see the remote desktop. You can still control the application, but it will be running on the local machine. You may also be able to use the protocol for a serial connection. 70238732e0
