Risk factors for upper respiratory infections in late pregnancy and early postpartum. To determine whether the rate of upper respiratory infections (URI) and associated risk factors are similar in late pregnancy and the early postpartum. A cohort of 615 women who had delivered at a university teaching hospital were prospectively recruited during their third trimester of pregnancy. A clinical interview was conducted by one of the authors, who was not involved in any obstetric care. The incidence of URI was measured for 12 weeks postpartum. Logistic regression analysis was used to determine the risk factors associated with URI. The overall incidence of URI was 68.8%. There was no difference in the incidence of URI between the third trimester and early postpartum (67.7% versus 70.5%; $P = .39$). The risk factors associated with URI were as follows: having had 2 or more babies in a 24-hour period ($P = .01$), smoking ($P = .01$), the presence of fever (P

Poly(arylene ether) polymers are well known, as are methods for making such polymers. Poly(arylene ether) polymers are commercially attractive materials because of their many advantages including good insulating properties, high temperature resistance, and/or excellent chemical resistance. Those of ordinary skill in the art know that the intrinsic viscosity $[\eta]$, or the limiting viscosity, as measured in a known viscosity fluid, such as decahydronaphthalene, is a well-known method for measuring the molecular weight of polymers. Intrinsic viscosity is the volume of a polymer solution that corresponds to a polymer having an intrinsic viscosity of one mill 2d92ce491b
