## Video-de-cavalo-cruzando-com-vaca atlaty

I think the most interesting thing about this is the first one. It's just a piece of metal with a magnet under it. The second one is a pretty large version. Which is less than 2cm long but still. The most interesting thing about the third one is the part that starts at the 11:20 mark. The magnet is also a piece of metal and it's sliding around a piece of glass. So it's an infinite number of possibilities. Let's say that there is a third one that is both the same as the first one and yet has a magnet under it. What does that look like? The magnet would need to be under the glass and move in an even opposite direction, right? Well, in this case, it's easier. If the magnet in the first one is sliding to the right, the magnet in the second one is sliding to the left. The third one would be sliding up. That would be kind of cool. Moving one way would be going back in time, the other would be going forward in time. So what would the fourth one look like? Oh, the magnet in the first one is sliding to the right and the magnet in the second one is sliding up. That would be kind of cool. The magnet in the second one is sliding down. Well, the magnet in the third one is sliding up and the magnet in the fourth one would be sliding left. The fifth one would be a mirror of the second one. The magnet in the third one is sliding up and the magnet in the fourth one is sliding down. That would be kind of cool. In the sixth one the magnet in the third one is sliding left and the magnet in the fourth one is sliding down. The magnet in the fourth one is sliding up. That would be cool. It's moving in all sorts of directions. The seventh one is the opposite of the fourth one. It's mirroring it. The magnet in the fourth one is sliding up and the magnet in the seventh one is sliding down. That would be kind of cool. The eighth one would be a reflection of the fourth one. The magnet in the fourth one is sliding down and the magnet in the eighth one is sliding up. That would be cool. The ninth one would be the opposite of the fifth one. It would be mirroring it. The magnet in the fifth one is sliding up and the magnet in the ninth one would be sliding down. That would be cool. The tenth one would be a reflection of the fifth one. The magnet
