By renterowes. AC Gintama Complete Ep 1 316Seasons 01 02 03 04 05 06 . A: I don't get the idea behind the code. str\_split doesn't create an array as far as I know. It splits a string and returns an array of the string (or the sub-string that is) in each element of the array. You need to use str\_split\_array if you want to use it in this way. Anyway, I don't think this is what you are looking for: \$id\_ar = str\_split( \$id\_ar ); \$id\_arr = \$id\_ar[0]; Since \$id\_ar = 'id\_ar'. As it's a string. You could do this instead: \$id\_ar = \$id\_ar; \$id\_arr = \$id\_ar[0]; or even: \$id\_ar = \$id\_ar[0]; Q: C# program is not recognizing the Visual Basic equivalent of an input box as a valid input So my C# program is supposed to ask a user for a variable of type double and then print out the sum of all the numbers they enter. The user can only enter a number, with the exe continuing if they press enter. However, I'm having issues with the program recognizing the "Input box" control. It doesn't recognize that it is for double, so even though I know that the program is meant to use double it thinks it's a int and tries to add all the ints to 2d92ce491b
