Potential role of arsenic in the pathogenesis of chronic diseases. There is evidence for the involvement of inorganic arsenic (As) in the etiology of a number of human diseases. The epidemiologic association between As-induced skin lesions and lung cancer incidence in Bangladesh and between As-induced skin lesions and glioma and pancreas cancer incidence in Taiwan have been well-documented. It is also observed that the degree of As-induced skin lesions was positively correlated with the severity of lung cancer in Bangladesh. Although the epidemiologic association between As-induced skin lesions and diabetic nephropathy has not been clearly demonstrated yet, most of the published reports suggest that As plays a role in the pathogenesis of the disease. In addition, inorganic As is a potent carcinogen in various organs of experimental animals. These accumulated data suggest that chronic exposure to inorganic As may be a risk factor for the development of several chronic diseases such as cancer and diabetes. Fig. \[fig:BN\] shows a planar relaxation of the analytically exact ground state of a Bose-Einstein condensate in the presence of a harmonically trapped potential as a function of the recoil energy E_R [Sackett2000]. The energy functional was already used in the optimized initial state reconstruction of Fig. \[fig:unitary-rho\]. !Planar relaxation of the analytically exact ground state of a Bose-Einstein condensate in the presence of an harmonic trap as a function of the recoil energy E_R . The projection of the actual harmonic confinement onto the planar state shows that the approach is independent of the trap geometry as long as the sum of the potential and trap scales is the recoil energy E_R \[from [Sackett2000]\]. \[data-label="fig:BN"\](color_plot){width="0.75\linewidth"} Projection of the numerical harmonic trap ----- In this section the harmonic trap is distorted to show the possibility of a planar ground state. To this end, 3ef4e8ef8d
