a method of making electrodes for an electrochemical energy storage cell. The electrodes are used in a rechargeable battery, such as a lead-acid battery, where the electrodes store chemical potential. 2. Description of Related Art Conventionally, lead-acid batteries are known for their high specific energy characteristics. A lead-acid battery is typically formed by an electrode structure wherein an electrolyte fluid layer is sandwiched between a positive electrode and negative electrode. Positive plate electrodes, typically formed of lead oxide, are electrically connected to a positive current collector by a lead wire. Negative plate electrodes, typically formed of lead dioxide, are electrically connected to a negative current collector by a lead wire. In conventional design, positive plate electrodes and negative plate electrodes are made by one of two fabrication techniques. One technique is to make the electrodes in discrete discrete areas to form the positive plate electrodes and the

In *A. fulgidus*, the AdiC monomer contains two substrate-binding sites (in blue). Strategies to target bacterial adhesion to metals usually focus on the extracellular domains of adhesins, while the underlying intracellular transport protein is often not considered an important target. However, AdiC is a highly conserved ABC transporter present in many different gram-positive and gram-negative bacteria. In gram-negative bacteria, AdiC is thought to be an important regulator of metal homeostasis, and is the primary transporter of iron into the cytoplasm. In a recent study, published in *Nature Microbiology*, researchers at MIT and elsewhere in the U.S. and Canada have figured out how bacterial adhesins can block the transport of metals by the AdiC transporter. Zhang et al. modeled the crystal structure of AdiC and then used energy minimization to study the interactions between AdiC and the cytoplasmic domains of the recently discovered bacterial adhesins. They showed that the binding site of the adhesins was blocked by the binding of iron to the AdiC, and concluded that the binding of adhesins to AdiC works in a similar manner to the targeting of bacterial adhesins to the primary binding sites of host proteins. Zhang et al. are now focusing on what these studies reveal about how AdiC functions as a metal-binding protein. Overall, the findings are likely to have broad implications for research on metal import proteins in many organisms. "The findings of this study suggest that bacterial adhesins can bind to metal trans
