Source Control - ApexSQL Source Control allows you to check the source code from SQL scripts and stored procedures in a version control system, such as Git or Mercurial. Sync - Diff - The Sync feature is the main source control feature. It monitors which tables, stored procedures and views have changed from the version on the host. Rollback - The rollback functionality allows you to revert to a specific version. Schedule Merge - ApexSQL Source Control can be run on its own schedule. This feature allows you to perform automated activities at pre-determined times. Schedule Push - ApexSQL Source Control can be run at pre-determined times to perform certain tasks.
