The software has incredible 3D modeling capabilities which gives you the

ability to design 3D models as accurately and cleanly as possible. With the design modeling tools you can be sure that your models will be accurate and of the highest quality. No problems with slicing and rotating objects to make them easier to design. The robot software is very light weight and easy to use. It's a very easy robot arm modeling software to use. Simply select the piece of hardware you would like to purchase and the software will tell

you how many are in a pack and what they cost. Very cool. The program allows you to select from a huge range of realistic robot arm hardware available. It also allows you to design the robot arm to your exact specifications and preferences. If you are not familiar with the use of CAD programs in the field of robot arms then this is the best place to start. There is no time in the robot arm design process that the robot arm you have designed will not

look completely different to the one you see on a robot you are using. There are many robot arm CAD programs but none which are as good as this. The robot arm software is compatible with Microsoft Windows 2000 and above. Very well done. I like the way you have presented the tools on

the main window, not just one available under the "File" menu, but those with basic usage are also available on the main tab. I use the term "simple" with the intent of being ambiguous. On the Windows/Linux/Mac desktop there are (IMHO) few occasions when a GUI (Graphical User Interface) is needed to undertake simple tasks - they are intended to do one thing and do it well. When I was young and relatively naive as a programmer, I adopted the

habit of checking the compatibility of everything I used with my operating system. What I discovered was that the mass of software that appeared to be "compatible" did not perform well on my machine so it was useless for me to install it. So I make a distinction between programs that can be used without any need for the GUI and the many that are not suitable for such usage. You need a GUI to undertake simple tasks and if you

are not able to use the GUI to undertake such tasks, why should you use a program which will give you a GUI anyway? While I appreciate that other people may like the GUI for its ease of use, I don't like it. It makes it too easy to do something that is not appropriate to the task at hand. I prefer an application that should be so intuitive that, when I need to do something simple, I should not need to look for the manual. I'm not proposing that all

application are unsuitable for UI use; they are not. But there are so many which are so poor, it is useless to add another bad one to the burden
