Probing the pH dependence of hydrophobic-hydrophilic interaction between lignin and dextran-like polymers for the facile recovery of lignin from lignin solution. The inherent hydrophobic-hydrophilic interaction between lignin and polysaccharide (PS) was firstly described by Kong et al. in 2009 to maximize the recovery of lignin from spent sulfite liquor (SSL). This study described the change of hydrophobic-hydrophilic interaction by the immobilized solids. In this work, dextran-like copolymer, Pdex/PGE (poly(dextran-co-glucose)) beads, were immobilized onto ferric oxide in aqueous solution. This Pdex/PGE beads was used to adsorb lignin from SSL. The change of hydrophobic-hydrophilic interaction between lignin and Pdex/PGE was observed by the change of α -d value of SSL. It was found that the Pdex/PGE beads showed excellent adsorption capacity for lignin in SSL. Most importantly, the Pdex/PGE beads were an effective way to enhance the lignin recovery from SSL.
