I want to find the limit of this summation. I tried the following: As the limit $\sum a_n$ exists, the limit $\lim_m \sum_{n=m}^{\infty} a_n$ also exists. Let L be this limit. Then $L = \lim_m \sum_{n=m}^{\infty} a_n = \lim_m \lim_{x \rightarrow \infty} \sum_{n=m}^x a_n = \lim_m L$. However this doesn't seem to be equal to $\lim_m \sum_{n=m}^{\infty} a_n$. Thanks. A: Hint: $\sum_{n=m}^{\infty} a_n = \sum_{n=m}^m a_n + \sum_{n=m+1}^{\infty} a_n$

Characterization of Avogadro's number from the Ehrenfest relation. In classical statistical physics, Planck's quantum constant is usually considered as a constant of nature. However, by taking into account its connection to Bose-Einstein condensation, one can get a different definition of the Boltzmann constant. Following the notation of a recent paper, this leads to a more convenient formulation of the second law of thermodynamics expressed in terms of the expected number of particles in a system that is in equilibrium. In this paper, the Avogadro constant ($N(A)$) is treated in a similar manner and reinterpreted as a number of microstates per macrostate. Also, a formula for the expected value of $N(A)$ and a law of thermodynamics relative to $N(A)$ are obtained, as for the Boltzmann constant. Our results are in agreement with the expected value of the ratio of these numbers./* * Copyright (c) 2009, 2019, Oracle and/or its affiliates.
