DownloadSPTPVplus2010Elitecrack. Ogg Theora v1.1.1.tar.gz . Description:
This is a complete collection of aortic and mitral valve annotations which are arranged in incremental order to show the development of aortic and mitral anatomy throughout gestation. For the hemodynamic evaluation of mitral and aortic valves, it is a must to obtain good quality echocardiographic images. The aortic valve and its root have not much calcification at approximately 27 weeks of gestation and, therefore, echocardiography can be performed easily and repeatedly throughout gestation. With the development of the aortic valve and its root, the aortic annulus becomes more elongated and the ventricular septum becomes thicker. It is these changes of the aortic root and the atria that make the echocardiographic evaluation of the mitral valve difficult at approximately 27 weeks of gestation. The mitral valve is more calcified at that time and the ventricular septum is less developed than the aortic valve. With these reasons and also because of a poor visualization of the mitral valve, hemodynamic evaluation of the mitral valve can be done in the beginning of the third trimester (37-40 weeks). We present a gallery containing several cases in which valvular anatomy was well visualized throughout gestation. We also demonstrate the development of the atria and the ventricular septum during gestation, explaining the reasons for the difficulties in fetal echocardiographic diagnosis of congenital heart diseases.
