A: It's a parameter of the dhclient3 script which initializes the dhcp client process. dhclient3 -f /etc/dhcp/dhclient.conf is used to specify a fixed host name. dhclient -r is used to specify a known-good root-path (e.g. the host is booted from a flash drive). Stopping the dhclient process doesn't necessarily kill the underlying DHCP request. You may need to terminate it explicitly with kill. Q: What's the difference between pre-emptive and non-pre-emptive scheduling? What's the difference between the two scheduling types? A: Pre-emptive scheduling is where the system is able to obtain more cycles from the CPU. If the system were to not be able to do this, it would be non-pre-emptive. So if you have a P4 CPU which is capable of eight 1 MHz clock cycles, and your OS runs with a 5 MHz clock speed, the system can service at most four concurrent processes. With pre-emptive scheduling this can be changed to five processes, because the system has more time to execute when the first process has finished. This is just one possible difference between the two types of scheduling. Read up on the other differences on wikipedia. A: Preemptive scheduling is when a running process is scheduled to end, and one of the running processes that has a higher priority is allowed to keep on running, and the rest of the running processes are told to wait. Non-preemptive scheduling is when a running process is allowed to run, and the operating system has no idea if it will end. The process can actually run forever, but the operating system can go sleep (i.e. run one of its other programs) and wait for the process to end. Q: Setting a private variable equal to another private variable First of all, I am doing some programming in python, and I have a class level private variable named 'counter', which is basically just a simple number. When I initialize it in the constructor, that number is the same as the currently running integer. How would I set the counter to the existing running integer? Why would I want to do this? I'm programming a game in python where the user can place order, but when the other player accepts the
