To do this, we first need the license number 1051 from the classview and then use the knowledge of many cases to find the correct letter. In some cases, we only need the number and can exclude all the regular letters to get the appropriate result. It takes some effort but we can work out the proper code by examining the correct license number. The License class contains some useful methods like getLicense() and isReadable() that we can use to verify the correctness of a license number. The problem is to loop through all the text cases to find the relevant one. To this end, we can use the following loop: . import java.util.\*; class LicenseWorker { public static void main(String[] args){ List licenses = new ArrayList(); String license = getLicense(); System.out.println(license); if (isReadable(
