This was back in 2005. I remember thinking, "Wow, this is really cutting edge stuff!" A quick Google search of that term brings up a search result with about 15,000 links. I remember being impressed when I read an article in the Journal of Pharmacology and Experimental Therapeutics that mentioned the term "stem cell therapy." I had no idea what the term meant at that time, but at least I knew that it was cutting edge medical research. Last year, I visited a sister school in another state for a weeklong medical electives program. As part of that trip, I visited a medical facility and talked with a stem cell researcher there. The term stem cell is part of a new and exciting field of research. Using stem cells to repair or replace damaged cells (stem cells) and using bone marrow transplants to treat diseases are two of the more common examples of this type of research. These types of therapies are being tested in humans and the results are being reported on. The FDA recently approved using stem cells in dogs to treat a few types of cancers and is currently reviewing the literature on human applications. The effects of stem cells are not fully understood but they are being investigated for a variety of clinical applications.--- title: Referencia del guía. description: Analice las siguientes información para obtener más información acerca de los grupos que pueden crear. ms. a1d647c40b
