* Go to `www.adobe.com` and search for `_Photoshop tutorials_`. * Download `_Photoshop CS4 Intermediate: The Missing Manual_` (Wiley Publishing, 2011) by Chuck Eubanks. It covers all the basics and is the perfect resource for beginners. * Practice and study the wonderful Adobe website online at `www.adobe.com/photoshop`. ## The Anatomy of an Image An image is made up of layers. You can have as many as eight layers in a single image, and each layer can be affected by a number of options, including transparency, which enables it to be viewed underneath other layers. Figure 1-1 shows an image with the layer settings, which include options for editing with bevels, pens, drop shadows, and so on. FIGURE 1-1: This image contains four layers, including a color layer, a black-and-white layer, a hue/saturation layer, and a layer with masks and a gradient.

Residents along Jamaica Bay could soon experience one of the costliest battles of the summer of 2018, when armed residents and law enforcement officers move in to try to repel hundreds of migrants from entering the country illegally. Residents of the communities along Jamaica Bay say they have been anticipating the “massive human invasion” for several weeks, with some residents preparing a “defensible” position along the Calhoun Parkway and Pelham Bay Park’s Rosebank area. “This is all based on a perception that we will be overrun by a flood of invader,” said Tom Dowdell, spokesperson for the Rosebank Community Association. “Unfortunately, there is a perception that we will be overrun, based on media reports.” But he said residents “have a stake in defending our community” and “will do what we can to help.” Gov. Andrew Cuomo said on Saturday that more than 500 migrants from Haiti and the Dominican Republic are headed for New York. But NYPD Police Commissioner James O’Neill said there were roughly 100 migrants in the NYPD’s custody as of Saturday night. A law enforcement source said that there were “hundreds” more awaiting processing and that the NYPD would “ramp up” its efforts to secure the southern border. The group of more than 500 migrants “seem like an invasion force,” said John Flowers, executive director of the Jamaica Coalition for Safety. The group — which includes Haitian and Dominican nationals, plus a few from the Ukraine and Mexico — is expected to leave its camp in South Carolina and cross into the United States around Monday. “We are not expecting it to be a large invasion,” Flowers said. “We are expecting those people to try to come into this country.” A source at the camp said Tuesday that the migrants had been told the crossing would take place on Sunday. The source said the camp was “being watched at all times,” and that if a large number of migrants attempted to enter the country illegally, “we are going to close it off.” A spokeswoman for Customs and Border Patrol could not be immediately reached for comment. Residents of the Rosebank Community Association said that extra volunteers were on standby, in addition to reserve police officers and reserve National Guard forces. A

The corrigendum for study of zero-length crosslinks in protein backbone alignment using high-resolution anomalous difference Fourier maps. In the study of protein-protein interactions, single crystal X-ray diffraction is used to probe conformational epitopes associated with binding site interactions. To detect the binding specificities of an antibody, a chemical crosslink is used to form a covalent, irreversible complex between the antibody and its ligand. In a first step, we used the commonly applied homologous protein backbone alignment (HPA) method to identify the structures of the native and crosslinked protein. When the crosslinked protein is only weakly bound and is only partially unfolded, as is the case for the immunoglobulin E (IgE)-antigen complex, a significant number of high-resolution map fragments were identified from a single 2.5-Å native data set and a corresponding 2.0-Å anomalous data set. Data from crystal form I of the crosslinked IgE-antigen complex, which contains no additional copies of the protein molecules, was sufficient to identify the native structure, identify the specific crosslinked residue pair, and reject models of incorrect crosslinking orientations. These data show that HPA methods can be used successfully in the study of protein-protein complexes. However, the resolution, completeness and the interpretability of the native data are not sufficient for a complete model of the crosslinked structure. In a subsequent step, the map fragments were used to calculate anomalous difference Fourier maps at the location of the crosslinker (a disulfide link between glycine 110 and cysteine 216) for all possible crosslinking positions. From the resulting correlation coefficients, the most likely crosslinking position was chosen. The correct orientation for the crosslink, which is a two-residue disulfide bridge between the third (not the first) and the fourth (not the second) cysteine of the native peptide chain, was clearly identified. Ben Harper – The Revolution As someone who voted for Obama, but was not sure he’d be able to support him when the time came, I haven’t really cared for much of what’s gone on in his first term. The idea that he’s not doing the job is just ridiculous, but I think we can all admit that he’s succeeded in producing some significant positive changes. So, I’m happy that he◆
