This program is designed for Microsoft SQL Server. It is comprehensive security auditing tool that audits Microsoft SQL Server databases for critical areas of security. It does not replace the Microsoft SQL Server management toolset, but complements it nicely by adding additional auditing

capability to the MS SQL Server. It does not rely on background tasks or services running on a server in order to perform audits. A background service is not required to perform audits, but the tool is still able to perform audits on as many databases on a server as the user wishes. It also supports Windows domain replication and federated databases in Microsoft SQL Server 2005 and later servers.
