Access and integrate vital health information with zero manual effort. Anytime, anywhere with a single interface What's more, HL7 is a standard that's supported by most in healthcare, making it a vital tool in the proper handling of patient data and a very valuable asset for doctors, nurses, allied healthcare professionals and even patients. Given all that, why isn't it more popular in a business environment? As an innovative tool, Smartie is promising: simple to use, highly customizable, and only requires a single interface on the same computer. Besides, it comes with the HL7 Toolkit, a library with a wide range of tools that are already integrated and ready for action. Based on the provided interface, you can explore the database operations, create queries, import and export records, send messages to your choice of recipients and even check the status of HL7 processing reports and statistics. If that's not enough, you can even export an HL7 archive to a .zip file and save it to your computer. However, this tool really shines when it comes to automatic HL7 data extraction using automatic HL7 parsers. If your job is translating HL7 messages between the hospital and the doctors' offices, there's no need to manually look through the messages. You can create one parsing tool and use it for all the incoming messages. Smartie will automatically find your parsing tool and import the messages into the database. How to unzip Smartie Once you've downloaded the archive, double-click it to decompress the archive and open the Smartie application. Next, run the app. If it doesn't open, check that the file is associated with the application and double-click it to open the application The next step is to load one of the provided solutions (see the guide above for more information) and run it.
