So, before importing a photo, be sure to name the file after the photo and the project. You may also want to import a second file with a transparent background, such as a background image. Or you can place your background image (a graphic or photograph) on a layer. With the background set, you can then import your photo over top. After the photo is imported, you then select the layer with your image (or layer) on it and edit the image's settings. You can edit the image's color settings and add layer styles, just as you would any other image. When you finish editing your photo, you can then delete the background graphic or photograph and change the background color. Figure 3-3 shows the Photo tab on the home screen.

[Antioxidant and prooxidant effects of ebselen on meningococcal lipopolysaccharide-induced proinflammatory cytokines expression in human synovial fibroblasts]. To investigate the effects of Ebselen (free radical scavenger) on the production of proinflammatory cytokines induced by meningococcal lipopolysaccharide (LPS) in human synovial fibroblasts (HIFs) and to define the role of reactive oxygen species (ROS) in the regulation of proinflammatory cytokines expression. To study the effects of Ebselen on the production of proinflammatory cytokines such as tumor necrosis factor-alpha (TNF-alpha), interleukin-1beta (IL-1beta) and interleukin-6 (IL-6), and to further explore its effects on the accumulation of ROS. The apoptosis of HIFs induced by Ebselen was also examined. Pretreatment with Ebselen (1, 2, 3, and 4 micromol/L) alone decreased the production of TNF-alpha, IL-1beta and IL-6 stimulated by LPS significantly; pretreatment with Ebselen (1 micromol/L) alone did not induce cytotoxicity in HIFs. Ebselen significantly inhibited the production of TNF-alpha, IL-1beta and IL-6 stimulated by LPS; LPS induced more ROS accumulation in HIFs, which was inhibited by the pre-treatment with Ebselen. The pre-treatment of HIFs with Ebselen (1, 2, 3, and 4 micromol/L) for 6 hours significantly decreased the apoptosis rate of HIFs induced by LPS. Ebselen could inhibit the production of proinflammatory cytokines induced by LPS. The activation of NF-kappaB and the accumulation of ROS induced by LPS might be a possible mechanism for the production of proinflammatory cytokines. The pre-treatment of HIFs with Ebselen could inhibit the inflammatory response and ROS production induced by LPS, thus decreasing the secretion of proinflammatory cytokines.Q: Can't connect to Docker Container from host Mac OS X I have a docker container running with this command docker run -p 5000:5000 demo.
