Effects of the ODM-SOD3 transgene on the diaphragmatic hemidiaphragm of the mdx mouse. Mice homozygous for the X-linked muscular dystrophy, dystrophinopathy gene, (mdx) are predisposed to diaphragmatic dysfunction. The most severe cases are those with an inactive dystrophin gene. The most common mutation causing inactive dystrophin genes in affected dogs is deletion of exons 5-7. This deletion causes a frameshift and premature termination codon in exon 8. We examined the effects of expressing a fully functional human dystrophin gene, ODM-SOD3, in mdx mice. Mdx mice were crossed with mice carrying the ODM-SOD3 transgene and the resulting F1 hybrid mice were crossed again to yield F2 hybrid mice. The effects of ODM-SOD3 on diaphragmatic function were investigated using in vivo and in vitro assays, including diaphragmatic muscle force measurements and measurements of citrate synthase activity and oxidative phosphorylation capacity. Acute exercise and contractile fatigue properties were similar in ODM-SOD3 transgenic and non-transgenic mdx mice. However, endurance of the diaphragm was increased in the transgenic mice. Our findings suggest that the ODM-SOD3 gene may have improved muscle performance by increasing oxygen utilization and/or by lowering metabolic activity.
