Smooth muscle cells from the pig carotid artery have been investigated by cytochemical techniques in order to study the distribution and intracellular localization of contractile elements and cytoskeletal proteins. Moreover, qualitative and quantitative cytochemical observations have been performed on arterial smooth muscle cells of human origin. In cultured pig carotid smooth muscle cells, actin, myosin, and spectrin have been shown to be co-localized in thick filament bundles and particularly in parallel bundles organized in a dense network at the cell periphery. Contractile proteins are also present in the perinuclear zone. In human smooth muscle cells, actin, myosin, and spectrin are organized in thick filament bundles at the cell periphery, but they are notably depleted from the contractile apparatus. In addition, human
