Working with layers Photoshop's central feature is its layer system. You can create and manipulate images with as many layers as you want. You can even combine layers and use layer masks to work on multiple elements in a single image. The process of combining layers, masking a layer, and painting with a layer mask is called _painting._ Every adjustment you make in Photoshop becomes a layer. For example, you can adjust the brightness, contrast, or color channels of an image, but those changes end up as a new layer. The following sections cover how to use layers in Photoshop.

It is possible to modify the size, rotation, and position of the stamp. You can also change the underlying pixels, which is sometimes necessary. It is possible to move the clone source anywhere on the image. You can "stack" stamps to do very sophisticated effects and fixes. Blur is a brush stroke that, once created, applies a blur effect to a specified area. The effect is scaled based on the brush width, so a brush stroke with a width of 5 pixels, for example, will apply a blur with a radius of 5 pixels. You can use this tool to soften or blur an image. You can also use the Blur tool to blur away large objects in a photo or to blur portions of the page that have too much detail. The Gradient tool provides you with a series of gradients that you can use to set the tone of an image. There are many different gradients available. The Gradient Selection tool makes it easy to add large areas of solid color to an image. When you apply the gradient to the image, it is automatically scaled to provide a more accurate color match. To control the size of the gradient, you can use the Gradient Bar. Gradients can also be used to represent a single color, a range of colors, or to produce a texture. The Pen tool allows you to paint by using a brush on the image. You can use the Pen tool to create abstract art, lettering, doodles, and more. You can create lines, rings, and ovals by using the Pen tool. The Puppet tool allows you to draw a three-dimensional figure on the screen. You can use the Puppet tool for perspective drawing or to create a figure or character. The Vector tool allows you to draw simple, straight lines, circles, rectangles, and polygons. You can use the Vector tool to outline areas in an image that you want to keep. Or you can use it to create textures. The Hand tool allows you to draw with your mouse. You can use the Hand tool for creating freehand drawing, sketches, and art. You can use the Hand tool to trace the edges of an image. You can also use the Hand tool to draw freehand. If you want to use a different color than you are currently using, simply change the Pen tool properties (Pen Color, Size, Stroke, and so on). In addition to the tools that are

Q: How to change layout on different devices? I have changed my program which was just an input box to a full screen layout on tablets. My problem is that if the tablet does not have enough screen real estate, the user still sees the old layout. How can I change the layout to a regular input box on a tablet with less than 5" screen real estate? On the desktop version of the layout, I can just set the height to 50% and have a regular input box. I don't know how to do this in the tablet mode. A: When designing your layout, you need to think about screen size and orientation. If it's a portrait layout (means it's larger in width than in height), you need to know the screen width first (e.g. 5 inches or 9.7 centimeters) and then set the height of the layout to be equal to 50% of the width. This means the height of the layout will take up less space than if you set the height to be the same as the width. If it's a landscape layout (means it's larger in height than in width), then you need to know the screen height first (e.g. 7 inches or 14.2 centimeters) and then set the width of the layout to be equal to 50% of the height. This means the width of the layout will take up less space than if you set the width to be the same as the height. If it's a portrait orientation that includes a landscape layout, then it's a bit of a pain because you'll get a white line between the two as you'll be forced to use a viewport. You can use the -12dp viewport to get around that. Note: This is a fun technique, but it's too difficult to do if you are going to release the app to the market.
