You can adjust and fine-tune your pictures using the Adjustments panel, discussed next, or in the other chapters of this book. You can also create special effects and backgrounds using the various Chapter 7 tools. Adjustments panel This panel, shown in Figure 11-7, gives you quick access to your image's different adjustments. The controls enable you to edit the image by changing values for brightness, contrast, sharpness, color balance, exposure, and saturation. This panel doesn't store your settings, so you need to adjust these settings again before taking a picture. You can also save your image in Photoshop using the Save For Web & Devices setting found in the File menu. Be sure you are saving your file for web and device use, though, because if you save it for print you need to create a new file. **Figure 11-7:** The Adjustments panel offers quick access to your image adjustments. When you open an image in Photoshop, the Adjustments panel appears in the workspace. In addition to the five sliders that I list in the following list, you may see four other controls: • Adjustment layer: Click the drop-down menu next to the Adjustment layer to choose whether to create a new adjustment layer or to modify the active layer using adjustment settings. • Layer mask: With the Layer Mask check box selected, you can see a thumbnail of a layer mask for the active layer. When you deselect the check box, the layer mask is hidden and disappears from view. • Active layer: The active layer is the image layer where you make changes. To the right of the Adjustments panel, you see the word Channels, which represents the various color layers that make up an RGB color image. You can click a channel or the Recolored image thumbnail to open the channel for editing. Note that if the image you open has only one layer (such as a black-and-white image), the Adjustments panel appears with the Adjustment layer only. Although you can't see the Adjustment layers in Figure 11-7, I created a solid red color with an Adjustment layer at the top of the image, as shown in Figure 11-8. Notice that the red layer has a red-overlay layer mask. The gray area shows what the mask will cover or hide when you make changes to it. **Figure 11-8:** The Adjustment layer controls

Q: Is there a version of the Neighborhood Machine that corresponds to the number of states of the Automaton? The Neighborhood Machine (NNM) is the canonical finite state machine for error detection in binary computation. See for example Multi-Error Detection in Finite State Machines, which explains in detail how the NNM works. In particular, a standard implementation of the NNM can have 2^k states, where k is the number of processing elements that have been used to generate the machine. For example, an NNM with one processing element would correspond to a DFA which has a single state and an input sequence that can only match that state once. Is there an equivalent mathematical formulation of the NNM such that the number of states corresponds to the number of states of the original State Machine? That is, is there some NNM that corresponds to a DFA for which k is equal to the number of states of the DFA? A: Yes and no, depending on what you mean by an equivalent mathematical formulation. There are many different formats for describing an NNM. One standard way of defining an NNM is to define the following binary counter, SCS, with $\sum_{i=1}^k \mathbb{1}_{S(i)=0}$.
