This way, any job that I submit takes X minutes to run and is dequeued. In my tasks database, I have a task that runs for 30 minutes, which I cannot change. I am scheduling this task so that it is set to run at 4:00 AM. If this task happens to take longer than X minutes, I want it to just repeat itself (ie, wake up at 4:00 AM, do its task, wait for 30 minutes and then repeat). How do I set this up in Quartz? Do I need to use the repeatCount property? If so, how do I set that property to make sure that

---

it will just run the task once and then go to sleep again? A: There are several ways to do this. If you are OK with executing the task multiple times, or do not mind if the task takes longer, your is simplest to set the repeatCount = 1 and just skip over the 30 minute. Schedule a job with a cron expression of [hour] [minute] \* \* \*/X and it will repeat the job every X minutes. If you do not mind the task taking longer, and want to run it just once, set the repeatCount to 1, but check to see if the task takes longer than the X minutes. This will run the task once, but if the task takes longer than the X minutes, if it runs longer than X minutes, quit the loop and try again. Q: PHP if else condition should execute one of the two conditions I have used a code as shown below, my problem is, if the if condition is not getting executed. Please help.

```
event_type_id == "1" || $data->event_type_id == "2" || $data->event_type_id == "3" || $data->event_type_id == "4" || $
```
