functionality, have facilitated the migration of digital computing systems from a place of limited usefulness and operability to a position as a foundation of many of our modern day operations. The speed, accuracy, and reliability of digital systems can be transformed from being merely useful to performing operations at a greatly increased and more consistent level. One of the most significant hurdles to be overcome in the transition to digital systems has been the development of storage systems which are suitable for mass storage of digital data. Much progress has been made in the transition to digital systems. The digital world of information exchange, productivity,

and progress is fast in developing new standards that will result in significant improvements in performance and functionality. Standards such as the IEEE 1394 standard and the Universal Serial Bus (USB) have been developed to meet the specific needs of the digital world and are increasing in use as the benefits of these standards become well known. One of the key to the advancement in the digital world is the connection of computers and peripheral devices to each other over bus networks. Various bus network standards have been created in an effort to allow high performance communications among devices. The performance achieved by the bus systems is,

however, limited by physical characteristics of the bus itself. The bandwidth of the bus is impacted by the physical dimensions of the bus. For example, the physical size of the connectors used to transmit data over a bus network can create size limitations on the bandwidth that the bus provides. The wiring between devices connected to the bus can also limit the maximum distance data can be transmitted over the bus. Fibre channel is a high performance, serial, full-duplex, point-to-point interconnect standard used for connecting storage systems such as disk arrays and other peripher
