The first version of Photoshop was released in 1995. More than 20 years later, the product continues to evolve. Adobe was acquired by Apple in 2008 for \$6.4 billion, and the two joined forces to help integrate Photoshop with the Mac OS. The program also introduced an array of new features, including tablet support, layer masks, node editing, and 3-D image manipulations. This article reviews the features that may be of interest to readers of OMG! Windows, the magazine for Windows technology enthusiasts. Photoshop vs. Pixelmator In recent years, a new contender called Pixelmator has risen to the Photoshop ranks. It uses an easy-to-use interface that is similar to the one used by Apple's own iPhoto and iMovie products. Pixelmator promises extensive customization using "painting tools" that enable you to change the look of images using brushes, nodes, and some pastes. However, its tagline is, "Pixelmator makes taking control of your photos fun." The program supports a limited number of transitions. Photoshop's strengths include its inherent ability to edit both raster and vector images. And like other image editing programs, Photoshop can convert images from one type to another. On a Mac, you can choose from Photoshop and Pixelmator on the Mac App Store for only \$9.99. After you purchase Pixelmator, it will be available to open and save Photoshop files for you. If you already own Adobe Photoshop, you can try the free version, which limits you to a maximum of 30 layers, one fill and stroke color for each layer, and black and white only. As part of the Apple v. Adobe lawsuit, the terms are based upon using the screen display itself. The program consists of menus, palettes, sliders, and toolbars. You can choose a tool or use one of the palettes to open a variety of tools. Although other products include these tools as well, it is easy to find these tools in Photoshop. Photoshop can hold five different palettes at a time. You can use the Spatial Toolkit palettes to modify the size, position, opacity, and style of an object. You can also set the resolution. The Image Panel contains the active layer. As layers are added, the layers panel is expanded. This is the same panel in which you view options for converting layers to paths. A menu bar is used

NASA's InSight lander touched down in Elysium Planitia on Monday, its first landing on Mars since it arrived at the Red Planet almost three months ago. Here's a round-up of the most significant moments from the landing. The InSight's solar panels have deployed Just over three hours after touching down, InSight's solar panels - the first to ever land on Mars - were jettisoned from the lander's heat shield and deployed. This was the first of many actions by the lander and its probes that will help scientists understand whether Mars once housed conditions conducive to life. InSight's in-depth look at Mars After touching down, InSight's mission operators instructed the lander to fire its computer systems to simulate what it will experience on the surface. What it found was a "hyper-mosaic," or hotspot, on the surface of Mars. And they believe that this could've been a dwelling for an ancient civilization. After this, InSight will begin executing its in-depth mission study that will not only seek to determine whether Mars was once home to life, but help scientists better understand how Earth's own geologic processes occurred. The team built a python probe Shortly after arriving on Mars, InSight also deployed a python probe - the first probe of its kind on Mars. This was an action taken by the team's robotic arm, which shot the device into the planet's atmosphere and fired a rocket that pushed it into the ground. It will help scientists assess the impact the lander had while landing. InSight's robotic arm also included a camera that produced the image below, which shows both the Python probe heading into the atmosphere as well as its landing site. It's unclear whether the camera, or the probe, will achieve its mission of capturing images of the landing site due to the treacherous terrain, but it was a first for the four instruments it carries. When can we see the images? According to InSight's Twitter account, it should take seven to 10 days for the camera on the robot to return a near-infrared image of the landing site.
