There are a couple of programs that are designed from the ground up to be used by hobbyists: Adobe's Photoshop Elements and Apple's iPhoto. Both programs are great for beginners who want to get a taste of photo editing. In fact, some people will use Elements to edit images before putting them into Photoshop to create custom web themes. Once you are comfortable with the basics, it's time to let Photoshop to your work. Learn about the primary areas you can use Photoshop for at home or in the office with a beginner's guide to Photoshop. Also, be sure to explore the Photoshop forums for help on any Photoshop related questions you may have.

**Step 1: Opening a File in Photoshop** This lesson will show you how to open a file in Photoshop. Once the file is open, you can use most of the features of Photoshop to edit the photo. To begin, you will create a new document.

1. Select File New .
2. Select Photoshop document.
3. Select OK. The new document opens. By default, the size is 600 by 400 pixels. Tip: The default size is perfect for most home users, but if you are doing a lot of image manipulation for work, you will want to make your document larger.

**Step 2: Creating a New Layer** A layer is a special type of document element that allows you to alter the image at a specific area. It keeps the original image on top of all edits in the layer.

1. Select Layer New .
2. Select Layer from the box at the bottom of the toolbox.
3. Select OK. You will now have a new layer on the active image. For now, it's the only layer. You will add layers later on to create an image with multiple layers. Photoshop layers can be transparent, which means that they can be combined with other layers. To add transparency to the layer, click on the eye icon located at the bottom left corner of the layer. A small box will appear on the layer. If you mouse-over the color of the layer, it will become transparent. You can also change the settings of a layer by clicking on the icon in the lower right corner of the layer. If you select the "lock" option, the layer will be locked and cannot be moved or edited. If you toggle the setting on the

Q: Apache Negotiation/Http2 or SPDY/H2? I am investigating Apache httpd configuration in windows and I can't seem to find a significant performance gain over the "reuse your connections" http2 configuration. SPDY seems to be installed as default on Windows and I understand that SPDY has caching in place so that the next request doesn't fetch the same asset from the cache. On http2 the next request from the same client will reuse the connection. I've seen tests and benchmarks that claim that http2 might win for intensive traffic. So which one should I use? http2 with inet-http-persistent and outet-http-persistent or SPDY with inet-spdy-persistent and outet-spdy-persistent? Thanks! Edit: I forgot to add that I have SPDY enabled in Windows 7 and inet-http-persistent and outet-http-persistent are enabled. A: SPDY / SPDY+ HTTP/2 is about resource saving of heavy stream processing on the same connection. It does not lose performance if your server serves the same content to many clients (e.g. load balancer). For performance reasons, SSL or if you plan to serve content to a very high number of users that differs per-request, SPDY/ HTTP/2 helps you reduce bandwidth. You are not able to use SPDY with a load balancer. It is solely for intra-server use. If you wanted to disable direct server to client communication you need to turn off the inet option. You need to pick an appropriate value for the inet When using the SPDY protocol, you would probably want to use the inet line. When using the HTTP/2 protocol, using the inet line would use only the initial connection. After that, connections are reused to send HTTP/1.1 requests. Having the inet is advantageous with SPDY for a number of reasons: You can use the SPDY protocol with a load balancer You can leverage the SPDY protocol without any knowledge of the architecture of the other side (e.g. the web server) and still enable compression and other features You have low DNS latency You can use the same server-side library (e.g. nginx) If your server does not already support SPDY, or SPDY is not enabled by default

Q: Showing that  $a, b, c$  are Pythagorean triple for any  $k \in \mathbb{Z}$  Let  $a, b, c, k \in \mathbb{Z}$  such that  $a^2 + b^2 = c^2 = k^2$ . How can I show that  $a, b, c$  are Pythagorean triple (all sides are even numbers) for any  $k \in \mathbb{Z}$ ? Obviously, for  $k=0$  or  $k=1$  it is easy to prove. But I am not sure how to show this for any integer  $k$ . A: If I am not mistaken, what you are trying to prove is the following: If  $a, b, c \in \mathbb{Z}$  and  $a^2 + b^2 = c^2$ , then there exist  $k, l \in \mathbb{Z}$  such that  $a = k^2 + l, b = k^2 - l, c = 2k$  (for any  $k \in \mathbb{Z}$ ). If that is correct, you will have to make use of the fact that, for any integers  $a, b$ , there exist integers  $k, l$  such that  $a = k^2 + l, b = k^2 - l$ . This, in turn, follows from the fact that  $\mathbb{Z}[i]$  is a Euclidean domain. To get to the assertion above, we will make use of the polynomial  $x^2 - k^2 \in \mathbb{Z}[x]$  which, for any integer  $k$ , will have a root with respect to  $x$ ; that is, there exists  $x_k \in \mathbb{Z}$  such that  $x_k^2 - k^2 = 0$ . In particular, we have that  $x_0 = -k$  is the root with the smallest absolute value. Letting  $\phi := (x_k - k)^2 - k^2$ , we note that, for any  $x \in \mathbb{R}$ , we have that  $x_k + k = x_k - x + k \iff (x - k)^2 = (x -$
