\* Photoshop Elements is a free, restricted version of Photoshop. You get all the same tools and features that Photoshop has to offer, but you don't get the tools and features that make Photoshop more expensive, such as layers. \* Photoshop is available for the Windows platform at [www.adobe.com/products/photoshop](http://www.adobe.com/products/photoshop). The Macintosh version is available from [www.adobe.com/products/photoshop](http://www.adobe.com/products/photoshop). If you don't have a copy of Photoshop or a website that offers free training for Photoshop (such as [www.mysdvd.net](http://www.mysdvd.net) or [www.iraifilm.com](http://www.iraifilm.com)), you can get online training at [www.photoshoptraining.com](http://www.photoshoptraining.com) or [Adobe.com/training](http://Adobe.com/training). \*\*Figure 3-1\*\* The Photoshop workspace with a picture and title layer. Photoshop as a Toner-Jet Printer Before I step through the installation of Photoshop, I want to help you understand the workflow of a typical Photoshop print job. In Figure 3-1, you can see a sample file with a set of layers. In my example, I created an image with a photo, color, and tints. I have loaded three types of layers into this file. Each type of layer represents a different format of print, and the layers are arranged in order to ensure that the proper print format is going to be automatically selected by the software. To make it even easier to understand, I used the printer driver for a laser printer (a Brother HL-2025) on which I printed the sample file in the print window in Figure 3-2. You can see that the color and photo layers are activated in the print preview window, which means that the software knows it is going to print the colored elements in the file. The top layer is the title layer, which I used to create a title that says, "Technical Tip: Creative Steps for My Photo," and the bottom layer is the background layer, which is just black. Before I begin, I want you to know what you are about to see. If you print your images at a print shop, you should be aware of how your shop handles color. For example, most shops will print your graphics in cyan (blue or royal) only or they will print in magenta (purple) only. Some shops will try to represent the full color spectrum, while others will only represent one or more narrow bands. If you are having trouble printing the image using the Photoshop print driver,

.x200)\*\*B\*\* & \*\*\*(x400)\*\* Dense lymphoplasmacytic infiltrate composed of lymphocytes and immunoblasts (H&E, x400) Discussion [#50003] ===== Langerhans cells are the professional APCs in the epidermis that are localized in the basal layer of the epithelium. They present foreign antigens to T cells in the lymph nodes to initiate a local and systemic immune response. Langerhans cells were first described by Paul Langerhans, who demonstrated their morphological resemblance to the cells of the mononuclear phagocyte system. They are specialized antigen-presenting cells responsible for antigen uptake and processing, and are considered the first line of defense against intracellular pathogens.^[@CIT0003]^ In some patients, the culprit drug is not detected, with immunosuppressive drugs being the most common drugs responsible for AGEF. In our case, paracortical cellular infiltrate is a prominent feature that has not been described in AGEF. We have seen paracortical distribution of the cells in other cases of drug-induced lesions. The paracortical involvement is the result of the cytotoxic immune response. We believe that this might contribute to severe granuloma formation and persistent disease. One study described the association of paracortical lymphadenopathy and AGEF related to intravenous immunoglobulin (IVIg).^[@CIT0008]^ In this case, lymphadenopathy was treated by excisional biopsy without medical management. Pathergy phenomenon is more often related to Lyme disease. Paracortical lymphadenopathy is seen in about 40% of cutaneous Lyme disease. The other features include pustular disease in 15% and erosive and ulcerative lesions in less than 5% of cases.^[@CIT0009]^ Paracortical lymphadenopathy is mostly seen in patients with recent tick bite and in those having erythema migrans.^[@CIT0010]^ The mechanism of this paracortical disease is still unclear. An association with Kocher's vein compression and thrombosis of the afferent lymph vessels has been described.^[@CIT0010]^ Filarial infestation of the lymph nodes has been suggested as a possible mechanism.^[

```
// other constructor if (error.Code == "ERR_CRASHED") return new HttpResponseMessage(error); throw error; } // other getter } public class A { private double _d; public double d { get { return _d; } set { _d = value; } } } A: In XunitTestCase, you define a required fixture parameter named "ShouldPassTest", which is the name of your test method, and also the name of the test method's assertion. This will work fine if the test method you want to run is the only one that applies to this fixture. However, if you also want to run the test method you registered for this fixture, you will need to call "ShouldPassTest". This requires a some amount of refactoring to your test fixture class. Xunit offers two different approaches for calling required methods. There is the TestCaller class which provides you this support. public class MyTestFixture : Xunit.Sdk.XunitFixture { private bool _shouldPassTest; [OneTimeSetUp] public void Setup() { _shouldPassTest = true; } [Test] public void TestOne() { _shouldPassTest = true; Assert.IsTrue(true); } [Test] public void TestTwo() { _shouldPassTest = true;
