Q: How to retrieve value of in the selected option of using JavaScript? Currently, I'm trying to develop an online e-book reader for my college project. The page is displayed in a modal window using the.modal() function. I have two tags: one is for selecting the chapters and the other for selecting which chapters to read. The page dynamically calculates the total amount of pages in the chapter and displays it as a tag. So far everything is working fine. Unfortunately I don't have enough understanding of JavaScript to modify the code, which is a school assignment. The project requires that I use Javascript to display all sections contained in the.docx file as an e-book. The main problem is that I'm unable to get the chapter name selected in the second select tag. When I try to do the equivalent of.click() it doesn't work. How can I do this? $('.chapters').on("change", function() { var totalNumOfPages = 0; var chapter = $(this).find(":selected").text(); console.log(chapter); $('.pages span').each(function() { totalNumOfPages += Number($(this).text()); }); $('#totalPages').text(totalNumOfPages); }); $("#target").click(function() { $("#modal-content").load("_update-modal.html", function() { $("#myModal").modal("show"); }); }); .book-content { background: rgba(7, 105, 162, 0.5); color: #ffffff; font-family: Poppins; } .book-cover { position: fixed; top: 12.4vh; left: 8.5vw; } .book-main-title { position: absolute; font-size: 36px; font-weight: 500; top: 6.6vh; left: 8.5vw;

Filters are used to create a variety of effects, such as stars, fire, or waves, among others. Layers organize your image into groups of pixels (and sometimes objects, such as text or graphics). You can create and edit layers, among other things. In this tutorial, you will learn how to use the Clone Stamp and the Healing Brush to repair images and art. The Clone Stamp The Clone Stamp tool, shown in Figure 1-1, allows you to digitally "clone" pixels from one place in your image and place them over another area. This is particularly useful for if a pixel or object has been deleted or accidentally moved elsewhere. You can also use the Clone Stamp for fine-tuning images, removing those little areas of noise, scratch, or other imperfections. The easiest way to use the Clone Stamp is to select the tool by pressing Cmd+U (Mac) or Ctrl+U (Windows), and then click on an area in your image where you want to insert the sampled pixels. Photoshop creates a copy of the selected pixels in the same place you clicked. You can set the size and Opacity of this virtual version of the original image and paint over the new pixels to apply a variety of effects. Figure 1-1: Use the Clone Stamp tool to copy and paste pixels. To use the Clone Stamp tool, follow these steps: 1. Select the Clone Stamp tool in the toolbox by pressing Cmd+U (Mac) or Ctrl+U (Windows). 2. Click in the image you want to sample pixels from. 3. Preview the new image with the Clone Stamp tool. You can set the size and Opacity of the preview. 4. Drag and drop the new version of the image or the Sampled Pixels from the Virtual Clone Window (in the Sample Pixels layer, as shown in Figure 1-2) to a new location in the image. Figure 1-2: The Clone Stamp tool creates a virtual image copy. 5. If you are happy with the sample that you just placed in your image, select Ctrl+Alt+Shift+S (Windows) or Cmd+Option+Alt+Shift+S (Mac OS) to permanently place this version of the image. 6. If not, click the None button (white arrow) and then select the Clone Stamp tool to get a fresh sample of the pixels. 7. Choose Opacity from the tool options. The Healing
